

[ABOUT SHIFTBY](#)

# The perspective begins with an observation.

Across industries, technologies, governance programs, cybersecurity investigations, manufacturing environments, supply chains, data initiatives, and AI adoption efforts, the same questions kept returning.

Why was this decision made?

What evidence existed?

What assumptions shaped it?

Who remained accountable?

What changed?

The records remained.

The explanation became harder to recover.

The pattern appeared repeatedly.

The observation became clear.

## Organizations preserve artifacts. Organizations struggle to preserve understanding.

That observation eventually became the foundation for ShiftBy.

The question was no longer whether the pattern existed. The question became how understanding could survive as execution continued to change.

Different environments. Similar questions.

The observation did not emerge from a single domain.

It appeared across industries that included consumer health, pharmaceuticals, MedTech, manufacturing, supply chain, research and development, and digital operations.

It appeared across business functions responsible for operations, manufacturing, supply chain, research and development, quality, compliance, risk management, cybersecurity, privacy, technology strategy, data and analytics, and AI governance.

It appeared across enterprise architecture, cloud platforms, data platforms, analytics environments, knowledge systems, cybersecurity programs, FinOps initiatives, governance platforms, and AI-enabled operating models.

Different industries.

Different business functions.

Different technologies.

The same questions continued to appear.

### Ananda Krishna Marri

Founder, ShiftBy

IAPP Certified AI Governance Professional (AIGP)

Across those environments, the same underlying questions continued to emerge: what had been decided, what evidence supported it, what assumptions shaped it, and how accountability carried forward as conditions changed.

The consistency of the pattern became difficult to ignore.

## DATA REMAINED AVAILABLE. KNOWLEDGE REMAINED VISIBLE. MEANING BECAME HARDER TO PRESERVE.

Over time, the observations began to reveal different dimensions of the same challenge.

Some questions were about execution: how decisions, actions, evidence, dependencies, and accountability remained connected over time.

Some were about meaning: how information, knowledge, context, and interpretation remained connected as organizations evolved.

Some were about discovery: how observations became knowledge and how knowledge informed decisions.

Across data platforms, analytics environments, knowledge systems, research environments, and AI-enabled ecosystems, the relationships that explain why something matters often became harder to recover than the information itself.

**AI did not create the challenge.**

**AI makes the challenge more visible.**

**Organizations pursuing enterprise AI, AI adoption strategies, and responsible AI programs often discover the challenge more quickly.**

As execution expands across people, systems, automation, and AI, organizations face the same underlying need with greater scale, speed, participation, automation, and complexity.

## How ShiftBy Explores The Challenge

ShiftBy explores the challenge through advisory work, coaching, thought leadership, and ongoing investigations.

**Decision Traceability   Organizational Memory**

**Human-AI Accountability   Adaptive Execution**

Over time, the recurring questions began to separate into three related dimensions: execution, meaning, and discovery.

UnifyPlane explores how execution remains understandable over time.

CanonLens explores how meaning remains connected to information and context.

Inspirail explores how discovery becomes knowledge and informs decisions.

Together, they helped shape the leadership perspective that became ShiftBy.

## Understanding Should Survive Change

Organizations change.

People change.

Technology changes.

Operating models change.

AI participates.

The artifacts may remain.

Understanding should remain with them.

That is the purpose of ShiftBy.

To help understanding survive change.

## The observation became the source. The work is preserving understanding through change.
